

### Introduction to Data Management

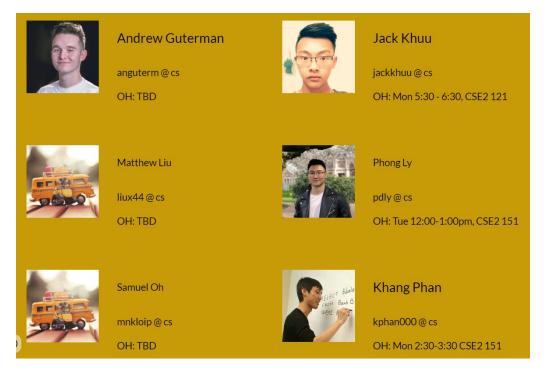

SQL, Keys, and Joins

Alyssa Pittman Based on slides by Jonathan Leang, Dan Suciu, et al

Paul G. Allen School of Computer Science and Engineering University of Washington, Seattle

#### Announcements

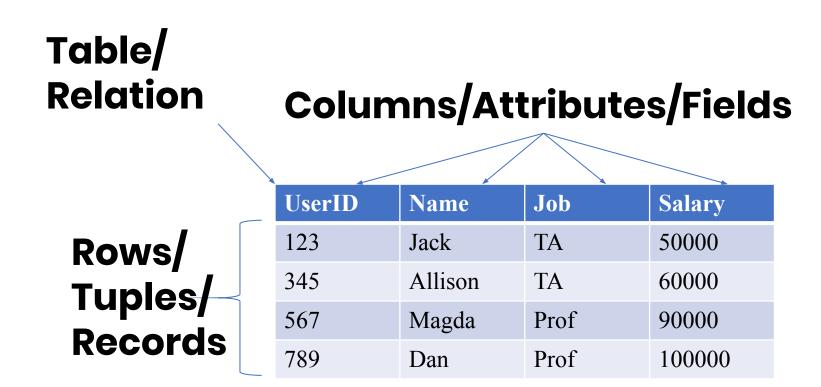

#### TA OH start next tomorrow

- HW1 released on the website
  - Let us know if you can't access your git repository!
  - Ask questions on Piazza

### Recap - The Relational Model

- Flat tables, static and typed attributes, etc.
  - "It's a spreadsheet with rules"

### Recap - The Relational Model

- Set semantics
  - No duplicate tuples
- Attributes are typed and static
  - INTEGER, FLOAT, VARCHAR(n), DATETIME, ...
- Tables are flat

#### Recap - SQL and RA

WHERE P.Job = TA';

SQL

(Next several lectures)

"What data do I want"

RA

(After SQL)

Allison

September 30, 2019 Aggle & September 30, 2019

#### Recap: For-each semantics

- Don't care about physical data layout or query plan
- But need to know the meaning of a query

# Goals for Today

- Last time we talked about the <u>barebone</u> building blocks of an RDBMS
  - Individual tables with no special properties
  - SQL and RA that work over individual tables
- Today is about semantics and relationships in the relational data model

#### Outline

- Keys □ Identification
- Foreign Keys 

  Relationships
- Joins in SQL
  - Inner joins
  - Outer joins
  - Self joins

#### Key

A **Key** is one or more attributes that uniquely identify a row.

#### **Payroll**

| UserID | Name    | Job  | Salary |
|--------|---------|------|--------|
| 123    | Jack    | TA   | 50000  |
| 345    | Allison | TA   | 60000  |
| 567    | Magda   | Prof | 90000  |
| 789    | Dan     | Prof | 100000 |

#### Key

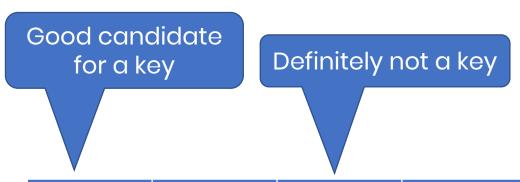

A **Key** is one or more attributes that uniquely identify a row.

#### Definitely not a key

| UserID | Name    | Job  | Salary |
|--------|---------|------|--------|
| 123    | Jack    | TA   | 50000  |
| 345    | Allison | TA   | 60000  |
| 567    | Magda   | Prof | 90000  |
| 789    | Dan     | Prof | 100000 |

#### Key

A **Key** is one or more attributes that uniquely identify a row.

| UserID | Name    | Job  | Salary |
|--------|---------|------|--------|
| 123    | Jack    | TA   | 50000  |
| 345    | Allison | TA   | 60000  |
| 567    | Magda   | Prof | 90000  |
| 789    | Dan     | Prof | 100000 |

#### Key

A **Key** is one or more attributes that uniquely identify a row.

Is this a good candidate for a key?

| UserID | Name    | Job  | Salary |
|--------|---------|------|--------|
| 123    | Jack    | TA   | 50000  |
| 345    | Allison | TA   | 60000  |
| 567    | Magda   | Prof | 90000  |
| 789    | Dan     | Prof | 100000 |

#### Key

A **Key** is one or more attributes that uniquely identify a row.

Is this a good candidate for a key?

| UserID | Name    | Job  | Salary |
|--------|---------|------|--------|
| 123    | Jack    | TA   | 50000  |
| 345    | Allison | TA   | 60000  |
| 567    | Magda   | Prof | 90000  |
| 789    | Dan     | Prof | 100000 |

#### Key

A **Key** is one or more attributes that uniquely identify a row.

Is this a good candidate for a key?

| UserID | Name    | Job  | Salary |
|--------|---------|------|--------|
| 123    | Jack    | TA   | 50000  |
| 345    | Allison | TA   | 60000  |
| 567    | Magda   | Prof | 90000  |
| 789    | Dan     | Prof | 100000 |
| 913    | Peter   | TA   | 60000  |

#### Key

A **Key** is one or more attributes that uniquely identify a row.

# Data comes from the real world so models ought to reflect that

| UserID | Name    | Job  | Salary |
|--------|---------|------|--------|
| 123    | Jack    | TA   | 50000  |
| 345    | Allison | TA   | 60000  |
| 567    | Magda   | Prof | 90000  |
| 789    | Dan     | Prof | 100000 |
| 913    | Peter   | TA   | 60000  |

```
CREATE TABLE Payroll (
   UserID INT,
   Name VARCHAR(100),
   Job VARCHAR(100),
   Salary INT);
```

Payroll(Userld, Name, Job, Salary)

```

- How do we capture relationships between tables?

23

#### **Foreign Key**

A **Foreign Key** is one or more attributes that uniquely identify a row in another table.

September 30, 2019 Aggregates 24

#### **Foreign Key**

A **Foreign Key** is one or more attributes that uniquely identify a row in *another table*.

Is this valid?

Payroll(<u>Userld</u>, Name, Job, Salary)

Regist(UserId, Car)

#### The Relational Model Revisited

- More complete overview of the Relational Model:
  - Database 

     collection of tables
  - All tables are flat
  - Keys uniquely ID rows
  - Foreign keys act as a "semantic pointer"
  - Physical data independence

#### Joins

- Foreign keys are able to describe a relationship between tables
- Joins are able to realize combinations of data

#### Inner Joins

- Bread and butter of SQL queries
  - "Inner join" is often interchangeable with just "join"

| UserID           | Name    | Job  | Salary |
|------------------|---------|------|--------|
| 123              | Jack    | TA   | 50000  |

| UserID | Car     |
|--------|---------|
| 123    | Charger |
| 567    | Civic   |
| 567    | Pinto   |

#### All pairs of cars a person can drive

```
SELECT P.Name, R1.Car
FROM Payroll AS P, Regist AS R1, Regist AS R2
WHERE P.UserID = R1.UserID AND
P.UserID = R2.UserID AND
```

R1.Car = 'Civic' AND R2.Car = 'Pinto';

### A little extra SQL

 ORDER BY – Orders result tuples by specified attributes (default ascending)

```
SELECT P.Name, P.UserID

FROM Payroll AS P
WHERE P.Job = 'TA'
ORDER BY P.Salary, P.Name;
```

DISTINCT – Deduplicates result tuples

```
SELECT DISTINCT P.Job
FROM Payroll AS P
WHERE P.Salary > 70000;
```

# Takeaways

- We can describe relationships between tables with keys and foreign keys
- Different joining techniques can be used to achieve particular goals
- Our SQL toolbox is growing!
  - Not just reading and filtering data anymore
  - Starting to answer complex questions
